

D

. 8. (top) Current patterns around Ouessant and wave rays for a wave period of 10 s and (bottom) wave model results in terms of wave height and mean directions. These are shown for (a),(b) the 0300 UTC high tide on 28 Oct, where both rays and wave model take into account the currents and water levels (c),(d) 1.5 h after the 0930 UTC low tide of the same day, which corresponds to Fig. 5b, without taking into account the currents, and (e) at the same time and now taking into account the currents. In the top panels, colors indicate the magnitude of the current and the arrows show the current direction. Superimposed on these are rays for waves of 10-s period, starting from parallel directions in deep water. The black dots give the locations of buoys 62052, to the west, DW106 close to Ouessant, 62029 to the south and DWFOUR to the east, as also shown on Fig. 2.
